the californian floristic province located on the pacific coast of north america is a region recognized as a biodiversity hotspot ÿ the area s rich floristic diversity is also reflected in its remarkable diversity of mygalomorph spiders the group that includes trapdoor spiders tarantulas funnel spiders and their other close relatives ÿ this monograph documents the species diversity currently attributed to the euctenizid genus aptostichus simon distributed primarily throughout california but also found in the habitats of arizona and nevada ÿ based on the examination of approximately 2000 specimens from museum and field collections 40 species are assessed 33 of which are new to science a dantrippi a cabrillo a pennjillettei a asmodaeus a nateevansi a chiricahua a icenoglei a isabella a muiri a barackobamai a sinnombre a hedinorum a aguacaliente a chemehuevi a sarlacc a derhamgiulianii a anzaborrego a serrano a mikeradtkei a edwardabbeyi a killerdana a cahuilla a satleri a elisabethae a fornax a lucerne a fisheri a bonoi a cajalco a sierra a huntington a dorothealangeae and a chavezi

Phylogenetic treatment and taxonomic revision of the trapdoor spider genus Aptostichus Simon (Araneae, Mygalomorphae, Euctenizidae)

2011-06-21

stephanidae leach 1815 hymenoptera stephanoidea is an imperfectly known family in its systematics and many types have never been studied since their descriptions at present 345 extant species are recorded worldwide and only twenty species in five genera are known from six provinces of china an extensive review of previously published literatures and previously unidentified specimens referred to stephanidae results in taxonomic revision of the family from china this monograph includes identification of six new species establishment of nine new synonyms and designation of one lectotype descriptions and illustrations of all chinese species are provided and keys to five genera from china and their species are made the results of this monograph clarify some taxonomic confusion richen the geographical distributions of stephanidae in china and provide facilities for further research in chinese stephanidae

A revision of the Chinese Stephanidae (Hymenoptera, Stephanoidea)

2013-04-24

stenamma is a cryptic leaf litter ant genus that occurs in mesic forest habitats throughout the holarctic region central america and part of northwestern south america colombia and ecuador the genus was thought to be restricted primarily to the temperate zone but recent collecting efforts have uncovered a large radiation of

neotropical forms which rival the holarctic species in terms of morphological and behavioral diversity by inferring a broad scale molecular phylogeny of *Stenamma* Branstetter 2012 showed that all neotropical species belong to a diverse middle american clade and that this clade is sister to an almost completely geographically separated holarctic clade. Here the middle american clade of *Stenamma* is revised to recognize 40 species of which 33 are described as new. Included in the revision are a key to species based on the worker caste and for each species where possible descriptions and images of workers and queens, images of males, information on geographic distribution, descriptions of intraspecific variation and notes on natural history. Several species groups are defined but the majority of species remain unassigned due to a lack of diagnostic morphological character states for most molecular clades.

Revision of the Middle American Clade of the Ant Genus *Stenamma* Westwood (Hymenoptera, Formicidae, Myrmicinae)

2014-03-31

The ant genus *Myrmica* in the Malagasy region is revised and six new species are described from Madagascar and its surrounding islands. The discovery of the division of females into major and minor forms was the key to solving this complicated taxonomic puzzle. We found that in some species of *Myrmica* major or minor workers develop as reproductives. In *Myrmica* morphological comparison among individuals from the same phenotype not from their reproductive or functional role is important. Here we propose a new taxonomic framework for interesting and mysterious genus. All species are reclassified into three subgroups based on the reproductive function and innovative pictorial keys to the species for all castes and sexes are developed. The associations between existing names and males are reexamined and males of eight of the ten Malagasy species are described or redescribed.

A revision of the ant genus *Myrmica* in the Malagasy region with description of six new species and remarks on *Amblyopone* and *Stigmatomma* (Hymenoptera, Formicidae, Amblyoponinae)

2012-08-06

Who knew there were so many bluegrasses in Mexico? This monographic study of the Mexican species of the large 500 species taxonomically complex world wide genus *Poa* by Smithsonian researchers Robert J. Soreng and Paul M. Peterson revealed there were 23 including 2 new to science and 2 previously unknown. There are two other narrow endemics described only in the last 10 years. The Mexican species occur mainly in the mountains and especially in the alpine. Most of the species occurrences in Mexico presumably reflect establishment during cooler climates of past glacial cycles. Today several are living on the edge of extinction. Eleven natives are globally rare or rare in Mexico. Breeding system diversity is high. Asexual seed production is obligate in several and facultative in some others. One is dioecious and some are gynodioecious. Several are perfect flowered. At least 3 arrived by long distance dispersal from South America. 2 aided by asexual reproduction, 1 by the capacity to self fertilize.

Revision of *Poa* L. (Poaceae, Pooideae, Poeae, Poinae) in Mexico: new records, re-evaluation of *P. ruprechtii*, and two new species, *P. palmeri* and *P. wendtii*
