body movements there are general anatomical terms that can be used to describe most movements the body makes most terms have a clear opposite and so are treated in pairs these pairs include flexion extension abduction adduction circumduction no opposite elevation depression internal medial rotation external lateral rotation

muscle attachments and actions learn muscle anatomy *Jun 08 2023*

2 muscles act on synovial joints to move the body the muscles surrounding synovial joints are responsible for moving the body in space these muscle actions are often paired like flexion and extension or abduction and adduction below the common terms are listed and defined with animations to help you picture the muscles and joints in motion
