the origin of life has been investigated by many researchers from various research fields such as geology geochemistry physics chemistry molecular biology astronomy and so on nevertheless the origin of life remains unsolved one of the reasons for this could be attributed to the different approaches that researchers have used to understand the events that happened on the primitive earth the origins of the main three members of the fundamental life system as gene genetic code and protein could be only separately understood with these approaches therefore it is necessary to understand the origins of gene the genetic code trna metabolism cell structure and protein not separately but comprehensively under a common concept in order to understand the origin of life because the six members are intimately related to each other in this monograph the author offers a comprehensive hypothesis to explain the origin of life under a common concept at the same time the author offers the gadv hypothesis contrasting it with other current hypotheses and discusses the results of analyses of genes proteins and the experimental data available in the exploration of the current knowledge in the field this book is of interest for science students researchers and the general public interested in the origin of life
