the author of hebrews is arguing that god himself has brought about the fulfillment of these institutions

through his son's priesthood his once for all sacrifice and the new covenant he inaugurated in the last days these new institutions are never denied the Jews in fact the context of the epistle presumes that these are primarily for the Jews considering that the author was speaking to a Jewish Christian community the author is not arguing for the abandonment by God of the Jewish people but rather for the abandonment of the shadowy means by which God's people drew near to him it is here we can speak of a qualified supersessionism according to the author of Hebrews the Levitical priesthood the Mosaic covenant and the Levitical sacrifices have been superseded by Jesus' priesthood the new covenant and Jesus' once for all sacrifice however we conclude that the polemical passages in Hebrews do not promote hatred of the Jews nor do they advocate the destruction of the Jewish people rather the author of Hebrews stresses the fulfillment of specific Jewish institutions for the benefit of the Jews it is this idea of fulfillment that rules out the charge that the epistle promotes the supersession of the Jewish people because of God's great love for his people he has provided a superior way by which his people can draw near to him from the conclusion

this book has evolved from our deep interest and involvement in the development and application of reliability evaluation techniques its scope is not limited to any one engineering discipline as the concepts and basic techniques for reliability evaluation have no disciplinary boundaries and are applicable in most if not all engineering applications we firmly believe that reliability evaluation is an important and integral feature of the planning design and operation of all engineering systems from the smallest and most simple to the largest and most complex also we believe that all engineers involved with such systems should be aware of and appreciate not only the benefits which can accrue from reliability assessment but also how such assessments can be made our primary objective has been to compile a book which provides practising engineers and engineering graduates who have little or no background in probability theory or statistics with the concepts and basic techniques for evaluating the reliability of engineering systems it is hoped that the material presented will

enable them to reach quickly a level of self confidence which will permit them to assimilate understand and appreciate the more detailed applications and additional material which is available in the journals and publications associated with their own discipline

this book presents a unified algebraic approach to stabilization problems of linear boundary control systems with no assumption on finite dimensional approximations to the original systems such as the existence of the associated riesz basis a new proof of the stabilization result for linear systems of finite dimension is also presented leading to an explicit design of the feedback scheme the problem of output stabilization is discussed and some interesting results are developed when the observability or the controllability conditions are not satisfied

this book grew out of lecture notes i used in a course on difference equations that i taught at trinity university for the past five years the classes were largely populated by juniors and seniors majoring in mathematics engineering chemistry computer science and physics this book is intended to be used as a textbook for a course on difference equations at the level of both advanced undergraduate and beginning graduate it may

also be used as a supplement for engineering courses on discrete systems and control theory the main prerequisites for most of the material in this book are calculus and linear algebra however some topics in later chapters may require some rudiments of advanced calculus since many of the chapters in the book are independent the instructor has great flexibility in choosing topics for the first one semester course a diagram showing the interdependence of the chapters in the book appears following the preface this book presents the current state of affairs in many areas such as stability z transform asymptoticity oscillations and control theory however this book is by no means encyclopedic and does not contain many important topics such as numerical analysis combinatorics special functions and orthogonal polynomials boundary value problems partial difference equations chaos theory and fractals the nonselection of these topics is dictated not only by the limitations imposed by the elementary nature of this book but also by the research interest or lack thereof of the author
