This book arose from courses taught by the authors and is designed for both instructional and reference use during and after a first course in algebraic topology. It is a handbook for users who want to calculate but whose main interests are in applications using the current literature rather than in developing the theory. Typical areas of applications are differential geometry and theoretical physics. We start gently with numerous pictures to illustrate the fundamental ideas and constructions in homotopy theory that are needed in later chapters. We show how to calculate homotopy groups, homology groups, and cohomology rings of most of the major theories, exact homotopy sequences of fibrations, some important spectral sequences, and all the obstructions that we can compute from these. Our approach is to mix illustrative examples with those proofs that actually develop transferable calculational aids. We give extensive appendices with notes on background material, extensive tables of data, and a thorough index. Audience: graduate students and professionals in mathematics and physics. This document is intended as a guide to the use of emmyxl, the expression-oriented line-by-line assembler developed by Hedges for the Stanford Emulation Lab. It is intended to be used along with the Principles of Operation for the Stanford Emmy TN no 65, Dec 1975, and the Emmy 360 Assembler TN no 74, Dec 1975. Various IBM OS/370 and VSII documents may also prove useful. Author catalog of the most often requested at T documents. This book grew from a one-semester course offered for many years to a mixed audience of graduate and undergraduate students who have not had the luxury of taking a course in measure theory. The core of the book covers the basic topics of independence, conditioning, martingales, convergence in distribution, and Fourier transforms. In addition, there are numerous sections treating topics traditionally thought of as more advanced, such as coupling and the KMT strong approximation, option pricing via the equivalent martingale measure, and the isoperimetric inequality for Gaussian processes. The book is not just a presentation of mathematical theory but is also a discussion of why that theory takes its current form. It will be a secure starting point for anyone who needs to invoke rigorous probabilistic arguments and understand what they mean. In today's hypercompetitive global marketplace, accurate cost estimating is crucial to bottom-line results. Nowhere is this more evident than in the design and development of new products and services among managing engineers responsible for developing realistic cost estimates for new product designs. The number one source of information and guidance has been the cost estimator.
