data recorded during flights of the nasa trailblazer boeing 737 have been analyzed to ascertain the presence of aircraft structural responses from various excitations such as the engine aerodynamic effects wind gusts and control system operations the nasa trailblazer boeing 737 was chosen as a focus of the study because of a large quantity of its flight data records the goal of this study was to determine if any

aircraft structural characteristics could be identified from flight data collected for measuring non structural phenomena a number of such data were examined for spatial and frequency correlation as a means of discovering hidden knowledge of the dynamic behavior of the aircraft data recorded from on board dynamic sensors over a range of flight conditions showed consistently appearing frequencies those frequencies were attributed to aircraft structural vibrations butterfield ansel j langley research centerboeing 737 aircraft structural vibration aerodynamics dynamic characteristics aircraft structures dynamic range exploration flight conditions gusts

an in depth history of the controversial airplane from its design development and service to politics power struggles and more the boeing 737 is an american short to medium range twinjet narrow body airliner developed and manufactured by boeing commercial airplanes a division of the boeing company originally designed as a shorter lower cost twin engine airliner derived from the 707 and 727 the 737 has grown into a family of passenger models with capacities from 85 to 215 passengers the most recent version of which the 737 max has become embroiled in a worldwide controversy initially envisioned in 1964 the first 737 100 made its first flight in april 1967 and entered airline service in february 1968 with lufthansa the 737 series went on to become one of the highest selling commercial jetliners in history and has been in production in its core form since 1967 the 10 000th example was rolled out on 13 march 2018 there is however a very different side to the convoluted story of the 737 s development one that demonstrates a transition of power from a

primarily engineering structure to one of accountancy number driven powerbase that saw corners cut and the previous extremely high safety methodology compromised the result was the 737 max having entered service in 2017 this model was grounded worldwide in march 2019 following two devastating crashes in this revealing insight into the boeing 737 the renowned aviation historian graham m simons examines its design development and service over the decades since 1967 he also explores the darker side of the 737 s history laying bare the politics power struggles changes of management ideology and battles with airbus that culminated in the 737 max debacle that has threatened boeing s very survival

given financial constraints the department for environment food and rural affairs and the environment agency have done a good job in improving the cost effectiveness of their approach to flood risk management they have adopted rational methods to prioritise spending on both new capital flood defences and maintaining existing ones however risks remain to the sustainability of current levels of flood protection the agency will need to make difficult decisions about how it prioritises its maintenance budget including some defences where it will need to reduce or stop maintenance in these cases there is a risk that lack of maintenance will mean that capital costs are incurred sooner when defences require replacement earlier since our evidence session the agency has published a long term investment strategy which presents a number of flooding scenarios and outlines how much funding would be needed to protect against these
