relax it's much easier than you think just like moving to a new city everything will seem unfamiliar at first but with a little help from some maps you'll soon be finding your way around like a pro once you become familiar with the constellations and how they appear to move across the night sky the rest is easy if you do not have maps of your own try visiting your local library or one of many online sites that can generate them they give object positions in great detail and most have a key of greek letters to help you understand star hop instructions

The Night Sky Companion 2007-06-04 this book demonstrates the use of an 80mm refractor and shows how it can be used as a real scientific instrument the author is an experienced small telescope user and an astronomy educator and he provides step by step instructions for numerous scientific activities users will find many activities and projects suitable for an 80mm refractor or 90mm reflector or maksutov that have not been published elsewhere emphasis is on measurement and discovery activities rather than on casual observing this book will provide amateur observers with the knowledge and skill that will help them make genuine contributions to the field of astronomy

Real Astronomy with Small Telescopes 2007-12-20 arditti's approachable work covers all the details of design siting and construction once a basic type has been decided upon it is written in a way that is equally applicable to the USA and UK where there are slightly different building regulations and deals with matters that are basic to building and commissioning any amateur observatory uniquely david arditti also considers the aesthetics of amateur observatories fitting them in with family and neighbors and maybe disguising them as more common garden buildings if necessary every amateur astronomer who wants a purpose built observatory and let's face it which one of them doesn't will find this book invaluable

Setting-Up a Small Observatory: From Concept to Construction 2007-09-20 this book is based around the author's beautiful and sometimes awe inspiring color images and mosaics of deep sky objects the book describes how similar hubble class images can be created by amateur astronomers in their back garden using commercially available telescopes and CCD cameras subsequent processing and image enhancement in the electronic darkroom is covered in detail as well a range of telescopes and equipment is considered from the author's 11 inch with hyperstar camera down to more affordable instruments appendices provide links to free software not available from a single source and are themselves an invaluable resource

Making Beautiful Deep-Sky Images 2007-07-14 astrophysics is often with some justification regarded as incomprehensible without at least degree level mathematics consequently many amateur astronomers skip the math and miss out on the fascinating fundamentals of the subject in astrophysics is easy mike inglis takes a quantitative approach to astrophysics that cuts through the incomprehensible mathematics and explains the basics of astrophysics in accessible terms the reader can view objects under discussion with commercial amateur equipment
