digital models based on data from medical images have recently become widespread in the field of biomechanics this book summarizes medical imaging techniques and processing procedures both of which are necessary for creating bone models with finite element methods chapter 1 introduces the main principles and the application of the most commonly used medical imaging techniques chapter 2 describes the major methods and steps of medical image analysis and processing chapter 3 presents a brief review of recent studies on reconstructed finite element bone models based on medical images finally chapter 4 reveals the digital results obtained for the main bone sites

that have been targeted by finite element modeling in recent years

a review of the radiosensitivity of the tissues in bone is a report prepared by the task group for the international commission on radiological protection committees 1 and 2 the book reviews a biological indicator of the maximum permissible radiation dose data shows that an induction of malignant change should be considered as the limiting factor in maximum permissible levels for the bone the risk of carcinogenesis in cells is connected with the proliferative potential of the cells these cells are on bone marrow surfaces in hematopoietic marrow and in certain epithelial cells close

to bone surfaces the text also reviews the changes in the patterns of distribution resulting from growth and remodeling of bone the book examines the effect of distribution of alkaline earth of plutonium of thorium of americium and of phosphorus in bone growth the book also evaluates the comparative tumorigenic effects of external and internal irradiation of bone and the factors to be considered in determining the dose limitation from bone seeking radionuclides this book can prove beneficial to researchers and practitioners in the fields of radiology internal medicine or oncology

bone remodeling process mechanics biology and numerical modeling provides a literature review the first part of the book discusses bones in a normal physiological condition bringing together the involved actors and factors reported over the past two decades and the second discusses pathological conditions highlighting the attack vectors of each bone disease the third part is devoted to the mathematical descriptions of bone remodeling formulated to develop models able to provide information that is not amenable to direct measurement while the last part focuses on models using the finite element method in investigating bone biomechanics this book creates an overall image of the complex communication network established between the diverse remodeling actors based on overwhelming control evidence revealed

over recent years as well as visualizes the remodeling defects and possible treatments in each case it also regroups the models allowing readers to analyze and assess bone mechanical and biological properties this book details the cellular mechanisms allowing the bone to adapt its microarchitecture to the requirements of the human body which is the main issue in bone biology and presents the evolution of mathematical modeling used in a bone computer simulation each chapter covers a core topic in bone biomechanics provides a multidisciplinary view that effectively links orthopaedics cellular biology mechanics and computer simulation draws an overall image about bone biology and cell interactions for identifying cell populations that are crucial for the remodeling process
