this self contained monograph presents matrix algorithms and their analysis the new technique enables not only the solution of linear systems but also the approximation of matrix functions e g the matrix exponential other applications include the solution of matrix equations e g the lyapunov or riccati equation the required mathematical background can be found in the appendix the numerical treatment of fully populated large scale matrices is usually rather costly however the technique of hierarchical matrices makes it possible to store matrices and to perform matrix operations approximately with almost linear cost and a controllable degree of approximation error for important classes of matrices the computational cost increases only logarithmically with the approximation error the operations provided include the matrix inversion and lu decomposition since large scale linear algebra problems are standard in scientific computing the subject of hierarchical matrices is of interest to scientists in computational mathematics physics chemistry and engineering

a lexically based corpus driven theoretical approach to meaning in language that distinguishes between patterns of normal use and creative exploitations of norms in lexical analysis patrick hanks offers a wide ranging empirical investigation of word use and meaning in language the book fills the need for a lexically based corpus driven theoretical approach that will help people understand how words go together in collocational patterns and constructions to make meanings such an approach is now possible hanks writes because of the availability of new forms of evidence corpora the internet and the development of new methods of statistical analysis and inferencing hanks offers a new theory of language the theory of norms and exploitations the which makes a systematic distinction between normal and abnormal usage between rules for using words normally and rules for exploiting such norms in metaphor and other creative use of language using hundreds of carefully chosen citations from corpora and other texts he shows how matching each use of a word against established contextual patterns plays a large part in determining the meaning of an utterance his goal is to develop a coherent and practical lexically driven theory of language that takes into account the immense variability of everyday usage and that shows that this variability is rule governed rather than random such a theory will complement other theoretical approaches to language including cognitive linguistics construction grammar generative lexicon theory priming theory and pattern grammar
