widely regarded as a standard work in its field this book introduces the range of processing techniques that are used in food manufacturing it explains the principles of each process the processing equipment used operating conditions and the effects of processing on micro organisms that contaminate foods the biochemical properties of foods and their sensory and nutritional qualities the book begins with an overview of important basic concepts it describes unit operations that take place at ambient temperature or involve minimum heating of foods subsequent chapters examine operations that heat foods to preserve them or alter their eating quality and explore operations that remove heat from foods to extend their shelf life with minimal changes in nutritional quality or sensory characteristics finally the book reviews post processing operations including packaging and distribution logistics the third edition has been substantially rewritten updated and extended to include the many developments in food technology that have taken place since the second edition was published in 2000 nearly all

unit operations have undergone significant developments and these are reflected in the large amount of additional material in each chapter in particular advances in microprocessor control of equipment minimal processing technologies genetic modification of foods functional foods developments in active or intelligent packaging and storage and distribution logistics are described developments in technologies that relate to cost savings environmental improvement or enhanced product quality are highlighted additionally sections in each chapter on the impact of processing on food borne micro organisms are included for the first time
