anxieties of interiority and dissection in early modern spain brings the study of europe s culture of dissection to the iberian peninsula presenting a neglected episode in the development of the modern concept of the self enrique fernandez explores the ways in which sixteenth and seventeenth century anatomical research stimulated both a sense of interiority and a fear of

that interior s exposure and punishment by the early modern state examining works by miguel de cervantes maría de zayas fray luis de granada and francisco de quevedo fernandez highlights the existence of narratives in which the author creates a surrogate self on paper then dissects it he argues that these texts share a fearful awareness of having a complex inner self in a country where one s interiority was under permanent threat of punitive exposure by the inquisition or the state a sophisticated analysis of literary religious and medical practice in early modern spain fernandez s work will interest scholars working on questions of early modern science medicine and body politics
