amidst the dramatic real estate fluctuations in the first decade of the twenty first century this study recognized that there is a necessity to create a real estate prediction model for future real estate ventures and prevention of losses such as the mortgage meltdown and housing bust this real estate prediction model study sought to reinstall the integrity into the american building and development industry which was tarnished by the sudden emergence of various publications offering get rich quick schemes in the fast paced and competitive world of lending and real estate development it is becoming more complex to combine current and evolving factors into a profitable business model this prediction model correlated past real estate cycle pinpoints to economical driving forces in order to create an ongoing formula the study used a descriptive secondary interpretation of raw data already available quarterly data was taken from the study s seven independent variables over a 24 year span from 1985 to 2009 to examine the correlation over two real estate cycles public information from 97 quarters 1985 2009 was also gathered on seven topics consumer confidence loan origination volume construction employment statistics migration gdp inflation and interest rates the null hypothesis underwent a test of variance at a 05 level of significance multiple regression analysis uncovered that four of seven variables have correlated and could predict movement in real estate cycle evidence from previous data based in the inland empire gdp interest rates loan origination volume and inflation were the four economical driving variables that completed the inland empire s real estate prediction model and global test findings from this study certify that there is correlation between economical driving factors and the real estate cycle these correlations illustrate patterns and trends which can become a prediction model using statistics by interpreting and examining the data this study believes that the prediction model is best utilized through pinpointing an exact numerical location by running calculations through the established global equation and recommends further research and regular update of quarterly trends and movements in the real estate cycle and specific variables in the formula

the power of the ever increasing tools and algorithms for prediction and their paradoxical effects on risk the age of prediction is about two powerful and symbiotic trends the rapid development and use of artificial intelligence and big data to enhance prediction as well as the often paradoxical effects of these better predictions on our understanding of risk and the ways we live beginning with dramatic advances in quantitative investing and precision medicine this book explores how predictive technology is quietly reshaping our world in fundamental ways from crime fighting and warfare to monitoring individual health and elections as prediction grows more robust it also alters the nature of the accompanying risk setting up unintended and unexpected consequences the age of prediction details how predictive certainties can bring about complacency or even an increase in risks genomic analysis might lead to unhealthier lifestyles or a gps might encourage less attentive driving with greater predictability also comes a degree of mystery and the authors ask how narrower risks might affect markets insurance or risk tolerance generally can we ever reduce risk to zero should we even try this book lays an intriguing groundwork for answering these fundamental questions and maps out the latest tools and technologies that power these projections into the future sometimes using novel cross disciplinary tools to map out cancer growth people s medical risks and stock dynamics
