the effects of nonlinear temperature distributions resulting from solar radiation on highway bridge decks are investigated a finite difference heat flow model was developed and used to determine the distributions of temperatures to be expected in various highway bridge structures and the general validity of the model was established by means of comparisons between measured and predicted temperature distributions in the kishwaukee river bridge a large box girder structure weather data from 26 stations in the united states were studied in order to determine the limiting values of probable temperature differences over the depths of girders in different geographical regions the bending moments induced in various continuous bridges were studied with the aim of isolating the most critical cases recommendations about design are made as are recommendations for additional study of some factors relating to the design process

physiological adaptations for breeding in birds is the most current and comprehensive account of research on avian reproduction it develops two unique themes the consideration of female avian reproductive physiology and ecology and an emphasis on individual variation in life history traits tony williams investigates the physiological metabolic energetic and hormonal mechanisms that underpin individual variation in the key female specific reproductive traits and the trade offs between these traits that determine variation in fitness the core of the book deals with the avian reproductive cycle from seasonal gonadal development through egg laying and incubation to chick rearing reproduction is considered in the context of the annual cycle and through an individual s entire life history the book focuses on timing of breeding clutch size egg size and egg quality and parental care it also provides a primer on female reproductive physiology and considers trade offs and carryover effects between reproduction and other life history stages in each chapter williams describes individual variation in the trait of interest and the evolutionary context for trait variation he argues that there is only a rudimentary and in some cases nonexistent understanding of the physiological mechanisms that underpin individual variation in the major reproductive life history traits and that research efforts should refocus on these key unresolved problems by incorporating detailed physiological studies into existing long term population studies generating a new synthesis of physiology ecology and evolutionary biology
