Rethinking the Coordinate-Subordinate Dichotomy 2011-12-22 this study argues that the domain traditionally covered by coordination and subordination in english can be subdivided into four distinct construction types the constructions are defined on the basis of differences in their interpersonal structure i e the grammatical encoding of speaker attitude and speaker interlocutor interaction it is shown that the four types constitute syntactically semantically and pragmatically coherent categories with differences in interpersonal structure defining and motivating distinct syntactic behaviour distinct pragmatic functions and distinct semantic classes of clause linkage the validity of the analysis is demonstrated in three ways first it is shown that the analysis can make sense of the wide range of apparently conflicting criteria found in the literature on complex sentences which can now be explained as reflections of four different construction types rather than as alternative perspectives on one single contrast between coordination and subordination second it is shown how the analysis can deal with two specific problems in the more general area of clause combining viz the syntactic basis of the distinction between content epistemic and speech act levels of clause linkage and the distinct discursive functions associated with initial and final position of adverbial clauses finally it is also shown that the proposed analysis is useful beyond the analysis of english with parallels in a number of cross linguistically recurrent phenomena of clause linkage the book is mainly of interest to linguistics researchers in the areas of syntax semantics and pragmatics as well as to graduate students with a focus on these fields

Skills in Mathematics - Coordinate Geometry for JEE Main and Advanced 2021-04-19 this monograph proposes a minimalist phase based approach to the derivation of coordinate structures utilizing the operations copy and match to account for both the symmetries and asymmetries of coordination data are drawn primarily from english german and dutch the basic assumptions are that all coordinate structures are symmetric to some degree in contrast to parasitic gap and many verb phrase ellipsis constructions and these symmetries especially with ellipsis allow syntactic derivations to utilize copy and match in interface with active memory for economizing with gaps and assuring clarity of interpretation with derivations operating at the feature level troublesome properties of coordinate structures such as cross categorial and non constituent coordination violations of the coordinate structure constraint as well as coordinate ellipsis gapping rnr left edge ellipsis are accounted for without separate mechanisms or conditions applicable only to coordinate structures the proposal provides support for central assumptions about the structure of west germanic
