Learn the basics of valve lash adjustment for mechanical and hydraulic lifters on big block Chevy and other engines. Follow the exhaust opening intake closing (EOIC) method to set the lash or preload on each cylinder without running the engine. A common sign of valve lash clearance that needs adjustment is a loud tapping or clicking noise from the top cylinder. The loud noise typically comes from the friction within the head cylinders. If you ignore this sign and continue driving for an extended period, the engine will lose power over time. Learn from top engine builders how to set and adjust valve lash for optimal performance and durability. Find out the best practices, tips, and tools for hydraulic and mechanical flat tappet cams. Learn how to check and adjust the clearance between the rocker arm and the valve stem on a solid lifter valvetrain. Find out the importance of valve lash, the EOIC method, and the difference between hot and cold lash when adjusting valve lash. It's essential to measure the intake valve clearance within 3 to 5 thousandths of an inch and the exhaust valve clearance between 5 to 7 thousandths of an inch to enhance performance. Aim for adjustments that fall in the middle of the specified clearance range. Learn how to set valve lash, the clearance between the rocker arm and valve tip in pushrod engines with the proper tools and methods. Valve lash adjustment can improve engine performance, reduce wear, and tune valvetrain. This method involves setting valves at specific points along the crankshaft rotation. Here's how it works on a V8: set two intake valves and two exhaust valves at the number 1 firing position, spin the engine over 180 degrees, and set four more valves. Do this spin and set two more times, and you're done. Disassembly: it all starts beneath the valve covers where 16 rockers (two per cylinder) are responsible for taking up the valvetrain slack during engine operation. Whether lashing valves, learn why valve lash is important for race engines and how to measure and adjust it using a feeler gauge. Find out how valve lash changes with temperature and how to compensate for it. Final lash adjustments should be made when the engine is at its operating temperature. If the final lash is set when the engine is cold, after the engine heats up, the change in lash will alter the duration of the camshaft. Setting lash when the engine is hot guarantees that the camshaft will perform as the cam manufacturer intended. 205k subscribers, subscribed 2.1k, 746k views, 12 years ago.
