principle be used to synthesize artificial text and discriminative techniques to classify text into predefined categories the first statistical language modeler was claudel Shannon in exploring the application of his newly founded theory of information to human language Shannon considered language as a statistical source and measured how well simple n gram models predicted or equivalently compressed natural text to do this he estimated the entropy of English through experiments with human subjects and also estimated the cross entropy of the n gram models on natural text the ability of language models to be quantitatively evaluated in this way is one of their important virtues of course estimating the true entropy of language is an elusive goal aiming at many moving targets since language is so varied and evolves so quickly yet fifty years after Shannon's study language models remain by all measures far from the Shannon entropy limit in terms of their predictive power however this has not kept them from being useful for a variety of text processing tasks and moreover can be viewed as encouragement that there is still great room for improvement in statistical language modeling
