Environmental Education in the Schools

1993

a fundamental and groundbreaking reassessment of how we view and manage cancer when we think of the forces driving cancer we don t necessarily think of evolution but evolution and cancer are closely linked because the historical processes that created life also created cancer the cheating cell delves into this extraordinary relationship and shows that by

understanding cancer's evolutionary origins researchers can come up with more effective revolutionary treatments athena aktipis goes back billions of years to explore when unicellular forms became multicellular organisms within these bodies of cooperating cells cheating ones arose overusing resources and replicating out of control giving rise to cancer aktipis illustrates how evolution has paved the way for cancer's ubiquity and why it will exist as long as multicellular life does even so she argues this doesn't mean we should give up on treating cancer in fact evolutionary approaches offer new and promising options for the disease's prevention and treatments that aim at long term management rather than simple eradication looking across species from sponges and cacti to dogs and elephants we are discovering new mechanisms of tumor suppression and the many ways that multicellular life forms have evolved to keep cancer under control by accepting that cancer is a part of our biological past present and future and that we cannot win a war against evolution treatments can become smarter more strategic and more humane unifying the latest research from biology ecology medicine and social science the cheating cell challenges us to rethink cancer's fundamental nature and our relationship to it
