any method of fitting equations to data may be called regression such equations are valuable for at least two purposes making predictions and judging the strength of relationships because they provide a way of empirically identifying how a variable is affected by other variables regression methods have become essential in a wide range of fields including the social sciences engineering medical research and business of the various methods of performing regression least squares is the most widely used in fact linear least squares regression is by far the most widely used of any statistical technique although nonlinear least squares is covered in an appendix this book is mainly about linear least squares applied to fit a single equation as opposed to a system of equations the writing of this book started in 1982 since then various drafts have been used at the university of toronto for teaching a semester long course to juniors seniors and graduate students in a number of fields including statistics pharmacology engineering economics forestry and the behavioral sciences parts of the book have also been used in a quarter long course given to master's and ph.d students in public administration urban planning and engineering at the university of illinois at chicago this experience and the comments and criticisms from students helped forge the final version

the first symposium on recent advances in problems of flow and transport in porous media was held in marrakech in june 96 and has provided a focus for the utilization of computer methods for solving the many complex problems encountered in the field of solute transport in porous media this symposium has been successful in bringing together scientists physicists hydrogeologists researchers in soil and fluid mechanics and engineers involved in this multidisciplinary subject it is clear that the utilization of computer based models in this domain is still rapidly expanding and that new and novel solutions are being developed the contributed papers which form this book reflect the recent advances in particular with respect to new methods inverse problems reactive transport unsaturated media and upscaling these have been subdivided into the following sections i numerical methods ii mass transport and heat transfer iii comparison with experimentation and simulation of real cases this book contains reviewed articles of the top presentations held during the international symposium on computer methods in porous media engineering which took place in giens france in october 1998 all of the presentations and the optimism shown during the meeting provided further evidence that computer modeling is making remarkable progress and is indeed becoming an essential toolkit in the field of porous media and solute transport i believe that the content of this book provides evidence of this and furthermore gives a comprehensive review of the theoretical developments and applications
