public concern about the safety and healthfulness of the food supply grew markedly during the 1980s numerous government academic interest group and media reports questioning the adequacy of the food safety regulatory system formed the basis for this increase in concern while public concern focused most directly on pesticide residues in food scientists emphasized the risks of illness associated with microbiological contamination of food much additional attention was focused on the food supply as a result of the striking consensus on dietary recommendations that emerged in the late 1980s based on increased scientific knowledge of linkages between diet and health relatively little research on the economic aspects of food safety and nutrition issues had been conducted up to the mid 1980s these aspects are complex on the consumer demand side they include consumers perceptions of the risks associated with particular food products how demographic characteristics influence consumers processing of risk information and subsequent analysis of food

demand behavior and the monetary value consumers might place on changes in the risk profiles of products the economic benefits and costs associated with current food consumption patterns are a major determinant of demand for improved food safety and dietary change through government regulation while a more complete picture of risks benefits and costs has been emerging recently much is yet unknown
