why does the world need excel data analysis modeling and simulation when spreadsheets rst became widely available in the early 1980s it spawned a revolution in teaching what previously could only be done with arcane software and large scale computing was now available to the common man on a desktop also before spreadsheets most substantial analytical work was done outside the classroom where the tools were spreadsheets and personal computers moved the work into the classroom not only did it change how the analysis curriculum was taught but it

also empowered students to venture out on their own to explore new ways to use the tools i can t tell you how many phone calls of ce visits and or emails i have received in my teaching career from ecstatic students crowing about what they have just done with a spreadsheet model i have been teaching courses related to spreadsheet based analysis and modeling for about 25 years and i have watched and participated in the spreadsheet revolution

this book provides a detailed how to guide addressing aspects ranging from analysis and design to the implementation of applications which need to be integrated within legacy applications and databases the analysis and design of the next generation of software architectures must address the new requirements to accommodate the internet of things iot cybersecurity blockchain networks cloud and quantum computer technologies as 5g wireless increasingly establishes itself over the next few years moving legacy applications into these new architectures will be

critical for companies to compete in a consumer driven and social media based economy few organizations however understand the challenges and complexities of moving from a central database legacy architecture to a ledger and networked environment the challenge is not limited to just designing new software applications indeed the next generation needs to function more independently on various devices and on more diverse and wireless centric networks furthermore databases must be broken down into linked list based blockchain architectures which will involve analytic decisions regarding which portions of data and metadata will be processed within the chain and which ones will be dependent on cloud systems finally the collection of all data throughout these vast networks will need to be aggregated and used for predictive analysis across a variety of competitive business applications in a secured environment certainly not an easy task for any analyst designer many organizations will continue to use packaged products and open source applications these third party products will need to be integrated into the new architecture paradigms and have seamless data aggregation capabilities while maintaining the necessary cyber compliances the book also clearly defines the roles and responsibilities of the stakeholders involved including the it departments users executive sponsors and third party vendors the book s structure also provides a step by step method to help ensure a higher rate of success in the context of re engineering existing applications and databases as well as selecting third party products conversion methods and cybercontrols it was written for use by a broad audience including it developers software engineers application vendors business line managers and executives
