when the impact of global warming on texas was first published in 1995 it discussed climate change as a likely future phenomenon predicted by scientific studies this entirely rewritten second edition presents evidence that early climate change impacts can now be observed and identifies the threats climate change will pose to texas through the year 2050 it also offers the hopeful message that corrective action if taken now can avert unmanageable consequences the book begins with a discussion of climate science and modeling and the information that can be derived from these sources for texas the authors follow this with an analysis of actual climate trends in the various texas climate regions including a predicted rise in temperatures of 5.4 degrees f plus or minus 1.8 f by the end of the century this could lead to less rainfall and higher evaporation especially in regions that are already dry other important effects include possible changes in el niño climate variability patterns and hurricane behaviors taking into account projected population growth subsequent chapters explore likely trends with respect to water availability coastal impacts and biodiversity the authors then look at the issues from a policy perspective focusing on texas's importance to the national economy as an energy producer particularly of oil and gas they recommend that texas develop its own climate change policy to serve the goals of reducing greenhouse gas emissions increasing energy independence ensuring regional security and improving management of water air land and wildlife

the theoretical and empirical literature to date has fallen short of reaching a consensus as to whether granting more managerial discretion to managers tends to enhance not alter or diminish organizational performance the discretion puzzle this book aims to build a bridge between these contradictory results by synthesising principal agent theory stewardship theory and managerial discretion theory into a new empirically validated model using a representative sample of double blind interviews with managers of 467 firms in china and applying partial least squares path modelling pls the study identifies a potential cause of the discretion puzzle the failure of the extant literature to account for granularity in the way that managers use their discretion this generates far reaching implications for theoretical and empirical research as well as practical recommendations for managing managers in multinationals and chinese companies
