Development of Normal Fetal Movements

2010-11-08

this work sees the light for various reasons there is a general lack of detailed information about the earliest stages of human motor development the reasons for this are explained more fully in the introduction here we may simply state that apart from their intrinsic interest earlier phenomena are fundamental to the comprehension of later phenomena rooted in them whether pathological or normal this is especially so in the rapidly veloping young organism at birth the neonate is catapulted into a profoundly different physical and social envir ment requiring extremely diverse functioning suffice it to mention aerial respiration no longer being fed through the placenta and the cord and the full impact of gravity on neonatal movements the neonate generally adapts smoothly to the transition as it has been equipped to do so during the 9 months of pregnancy however the study of the early stages of fetal motor development should not be exclusively directed towards the und standing of functioning in the neonate

Proceedings of International Conference on Computer Vision and Image Processing

2016-12-22

this edited volume contains technical contributions in the field of computer vision and image processing presented at the first international conference on computer vision and image processing cvip 2016 the contributions are thematically divided based on their relation to operations at the lower middle and higher levels of vision systems and their applications the technical contributions in the areas of sensors acquisition visualization and enhancement are classified as related to low level operations they discuss various modern topics reconfigurable image system architecture scheimpflug camera calibration real time autofocusing climate visualization tone mapping super resolution and image resizing the technical contributions in the areas of segmentation and retrieval are classified as related to mid level operations they discuss some state of the art techniques non rigid image registration iterative image partitioning egocentric object detection and video shot boundary detection the technical contributions in the areas of classification and retrieval are categorized as related to high level operations they discuss some state of the art approaches extreme learning machines and target gesture and action recognition a non regularized state preserving extreme learning machine is presented for natural scene classification an algorithm for human action recognition through dynamic frame warping based on depth cues is given target recognition in night vision through convolutional neural network is also presented use of convolutional neural network in detecting static hand gesture is also discussed finally the technical contributions in the areas of surveillance coding and data security and biometrics and document processing are considered as applications of computer vision and image processing they discuss some contemporary applications a few of them are a system for tackling blind curves a quick reaction target acquisition and tracking system an algorithm to detect for copy move forgery based on circle block a novel visual secret sharing scheme using affine cipher and image interleaving a finger knuckle print recognition system based on wavelet and gabor filtering and a palmpoint recognition based on minutiae quadruplets

Retinal Degenerative Diseases

2019-12-28

this book contains the proceedings of the xviii international symposium on retinal degeneration rd2018 a majority of those who spoke and presented posters at the meeting contributed to this volume the blinding diseases of inherited retinal degenerations have no treatments and age related macular degeneration has no cures despite the fact that it is an epidemic among the elderly with 1 in 3 4 affected by the age of 70 the rd symposium focused on the exciting new developments aimed at understanding these diseases and providing therapies for them since most major scientists in the field of retinal degenerations attend the biennial rd symposia they are known by most as the best and most important meetings in the field the volume presents representative state of the art research in almost all areas of retinal degenerations ranging from cytopathologic physiologic diagnostic and clinical aspects animal models mechanisms of cell death candidate genes cloning mapping and other aspects of molecular genetics and developing potential therapeutic measures such as gene therapy and neuroprotective agents for potential pharmaceutical therapy while advances in these areas of retinal degenerations were described there will be many new topics that either are in their infancy or did not exist at the time of the last rd symposium rd2016 these include the role of inflammation and

immunity as well as other basic mechanisms in age related macular degeneration several new aspects of gene therapy and revolutionary new imaging and functional testing that will have a huge impact on the diagnosis and following the course of retinal degenerations as well as to provide new quantitative endpoints for clinical trials the retina is an approachable part of the central nervous system cns and there is a major interest in neuroprotective and gene therapy for cns diseases and neurodegenerations in general it should be noted that with successful and exciting initial clinical trials in neuroprotective and gene therapy including the restoration of sight in blind children the retinal degeneration therapies are leading the way towards new therapeutic measures for neurodegenerations of the cns many of the successes recently reported in these areas of retinal degeneration sprang from collaborations established at previous rd symposia and many of those were reported at the rd2016 meeting and included in the current volume we anticipate the excitement of those working in the field and those afflicted with retinal degenerations is reflected in the volume

Inspiring Leadership in Teens

first published in 1987 contemporary psychology is increasingly diversified pluralistic and specialized and most psychologists venture beyond the confines of their substantive specialty only rarely yet psychologists with different specialties encounter similar problems ask similar questions and share similar concerns unfortunately there are very few arenas available for the expression or exploration of what is common across psychological subdisciplines the crosscurrents in contemporary psychology series is intended to serve as such a forum the chief aim of this series is to provide integrated perspectives on supradisciplinary themes in psychology despite its contemporary diversity and high degree of specialization psychology embraces many phenomena that are of interest across subdisciplines largely because of the generality and ubiquity of those phenomena the sensitive period is one sensitivity to different kinds of experience varies over the life cycle of an organism

this book re examines the dichotomy between the everyday and the disciplinary in mathematics and science education and explores alternatives to this opposition from points of view grounded in the close examination of complex classroom events it makes the case that students everyday experience and knowledge in their entire manifold forms matter crucially in learning sciences and mathematics the contributions of 13 research teams are organized around three themes 1 the experiences of students in encounters with everyday matters of a discipline 2 the concerns of curriculum designers including teachers as they design activities intended to focus on everyday matters of a discipline and 3 the actions of teachers as they create classroom encounters with everyday matters of a discipline as a whole the volume reflects the shift in the field of educational research in recent years away from formal structural models of learning toward emphasizing its situated nature and the sociocultural bases of teaching and learning at least two trends increasing awareness that formal theories can be useful guides but are always partial and provisional in how they disclose classroom experiences and the widespread availability of video and audio equipment that enables effortless recording of classroom interactions have reoriented the field by allowing researchers and teachers to look at learning starting with complex classroom events rather than formal theories of learning such examinations are not meant to replace the work on general theoretical frameworks but to ground them in actual complex events this reorientation means that researchers and teachers can now encounter the complexity of learning and teaching as lived human meaning making experiences immersion in this complexity compels rethinking assumptions about the dichotomies that have traditionally organized the field s thinking about learning further it has important implications for how the relationship between theory and practice in understanding teaching and learning is viewed everyday matters in science and mathematics studies of complex classroom events is an important resource for researchers teacher educators and graduate students in mathematics and science education and a strong supplemental text for courses in these areas and also in cognition and instruction and instructional design

one remarkable ability of the human brain is to process large amounts of information about our surroundings to allow us to interact effectively with them in everyday life the most common way to interact with objects is by reaching grasping lifting and manipulating them although these may sound like simple tasks the perceptual properties of the target object such as its location size shape and orientation all need to be processed in order to set the movement parameters that allow an accurate reach to grasp to lift movement several brain areas work in concert to process this outstanding amount of visual information and drive the execution of a motor plan in just a few hundred milliseconds how are these processes orchestrated in developing this type of comprehensive knowledge about the interactions between objects perception and goal directed actions we have a window into the mechanisms underlying the functioning of the visuo motor system with this research topic we aim to further understand the neural mechanisms that mediate our interactions with the world therefore we particularly encourage submission of papers that attempt to relate such findings to real world situations by investigating behavioural and neural correlates of information processing related to eye hand coordination and visually guided actions including reaching grasping and lifting movements this topic welcomes submissions of original research using any relevant techniques and methods from behavioural kinematics kinetics to neuroimaging and transcranial magnetic stimulation tms as well as
