in recent years what has come to be called the new mechanism has emerged as a framework for thinking about the philosophical assumptions underlying many areas of science especially in sciences such as biology neuroscience and psychology this book offers a fresh look at the role of mechanisms by situating novel analyses of central philosophical issues related to mechanisms within a rich historical perspective of the concept of mechanism as well as detailed case studies of biological mechanisms such as apoptosis it develops a new position methodological mechanism according to which mechanisms are to be viewed as causal pathways that are theoretically described and are underpinned by networks of difference making relations in contrast to metaphysically inflated accounts this study characterises mechanism as a concept in use in science that is deflationary and metaphysically neutral but still methodologically useful and central to scientific practice
