A Survey of the Principles and Practice of Wave Guides 2016-02-04

originally published in 1947 this book was written to provide an introductory survey of the developments in electromagnetic waves although the propagation of electromagnetic waves in metal tubes wave guides had been studied for over fifty years prior to the publication of this book the subject was primarily of theoretical interest the treatment in this book reflects the movement away from the theoretical to a more practical interest in waves during the war with the development of the first micro wave radar equipment in 1940 the first six chapters are based on courses on microwave techniques which were given during the war at the radar school of the telecommunications research establishment whilst chapter seven is a mathematical treatment of the subject this book will be of great value to scholars of the history of physics and electromagnetics

the field of nonlinear optics has witnessed a tremendous evolution since its beginnings in the early sixties its frontiers have been extended in many directions and its techniques have intruded upon many areas of both fundamental and practical interest the field itself has been enriched with many new phenomena and concepts that have further extended its scope and strengthened its connection with other areas as a consequence it is becoming increasingly unrealistic to expect to cover the different facets and trends of this field in the lectures or proceedings of a summer school however advanced these may be however much of the current progress and interest in this field springs to a large extent from the promise and expectation that highly performing all optical devices that exploit and operate on the principles of nonlinear optics will constitute an important branch of future technology and will provide new alternatives in information processing and transmission the conception of new devices in general requires an intricate and bold combination of facts and methods from most diverse fields in order to perform functions and operations that fit into an overall technological ensemble

modern optics is a fundamental study of the principles of optics using a rigorous physical approach based on maxwell s equations the treatment provides the mathematical foundations needed to understand a number of applications such as laser optics fiber optics and medical imaging covered in an engineering curriculum as well as the traditional topics covered in a physics based course in optics in addition to treating the fundamentals in optical science the student is given an exposure to actual optics engineering problems such as paraxial matrix optics aberrations with experimental examples fourier transform optics fresnel kirchhoff formulation gaussian waves thin films photonic crystals surface plasmons and fiber optics through its many pictures figures and diagrams the text provides a good physical insight into the topics covered the course content can be modified to reflect the interests of the instructor as well as the student through the selection of optional material provided in appendixes

this book is dedicated to metaheuristics as applied to vehicle routing problems several implementations are given as illustrative examples along with applications to several typical vehicle routing problems as a first step a general presentation intends to make the reader more familiar with the related field of logistics and combinatorial optimization this preamble is completed with a description of significant heuristic methods classically used to provide feasible solutions quickly and local improvement moves widely used to search for enhanced solutions the overview of these fundamentals allows appreciating the core of the work devoted to an analysis of metaheuristic methods for vehicle routing problems those methods are exposed according to their feature of working either on a sequence of single solutions or on a set of solutions or even by hybridizing metaheuristic approaches with others kind of methods
