locomotion involves many different muscles and the need of controlling several degrees of freedom despite the central nervous system can finely control the contraction of individual muscles emerging evidences indicate that strategies for the reduction of the complexity of movement and for compensating the sensorimotor delays may be adopted experimental evidences in animal and lately human model led to the concept of a central pattern generator cpg which suggests that circuitry within the distal part of cns i e spinal cord can generate the basic locomotor patterns even in the absence of sensory information different studies pointed out the role of cpg in the control of locomotion as well as others investigated the neuroplasticity of cpg allowing for gait recovery after spinal cord lesion literature was also focused on muscle synergies i e the combination of locomotor functional modules implemented in neuronal networks of the spinal cord generating specific motor output by imposing a specific timing structure and appropriate weightings to muscle activations despite the great interest that this approach generated in the last years in the scientific community large areas of investigations remain available for further improvement e g the influence of afferent feedback and environmental constrains for both experimental and simulated models however also supraspinal structures are involved during locomotion and it has been shown that they are responsible for initiating and modifying the features of this basic rhythm for stabilising the upright walking and for coordinating movements in a dynamic changing environment furthermore specific damages into spinal and supraspinal structures result in specific alterations of human locomotion as evident in subjects with brain injuries such as stroke brain trauma or people with cerebral palsy in people with death of dopaminergic neurons in the substantia nigra due to parkinson s disease or in subjects with cerebellar dysfunctions such as patients with ataxia the role of cerebellum during locomotion has been shown to be related to coordination and adaptation of movements cerebellum is the structure of cns where are conceivably located the internal models that are neural representations miming meaningful aspects of our body such as input output characteristics of sensorimotor system internal model

control has been shown to be at the basis of motor strategies for compensating delays or lacks in sensorimotor feedbacks and some aspects of locomotion need predictive internal control especially for improving gait dynamic stability for avoiding obstacles or when sensory feedback is altered or lacking furthermore despite internal model concepts are widespread in neuroscience and neurocognitive science neurorehabilitation paid far too little attention to the potential role of internal model control on gait recovery many important scientists have contributed to this research topic with original studies computational studies and review articles focused on neural circuits and internal models involved in the control of human locomotion aiming at understanding the role played in control of locomotion of different neural circuits located at brain cerebellum and spinal cord levels

despite advances in modeling such as graphical user interfaces the use of gis layers and databases for developing input files the approaches to modeling phosphorus p have not changed since their initial development in the 1980s current understanding of p processes has evolved and this new information needs to be incorporated into the current models filling this need modeling phosphorus in the environment describes basic approaches to modeling p how the current models implement these approaches and ways to improve them the book sets the scene with a review of general approaches to modeling runoff and erosion p in runoff leaching of p stream processes that affect p and an examination of the important issue of model uncertainty it describes state of the science watershed scale p transport models including dynamic semi disturbed models models of intermediate complexity and two lumped models phosphorus indexes pis represent one end of the modeling spectrum and the book takes a comprehensive look at pis developed in each state and illustrates

some of the problems encountered when incorporating pis into farm scale manure management software the book discusses monitoring data which is critical for calibrating models and concludes with suggestions for improving the modeling of p from researching mechanisms to applying regulations the uses of phosphorus models have increased as our knowledge of the effects of phosphorus in the environment has increased drawing on contributions from experts the book gives you the tools to select the model that best fits your needs

mobile technology offers an innovative and cost effective channel for delivering a range of financial services including mobile payments in some jurisdictions mobile payments simply provide a convenient option for facilitating payment transactions in other jurisdictions mobile payments are viewed as potentially transformative because they present an opportunity to expand access to financial services however as with other innovations mobile payments raise consumer protection concerns and require robust regulatory mechanisms to address such concerns against this backdrop the book adopts a typology of consumer policy tools which can be used to address the identified consumer concerns this typology guides the enquiry into the existing consumer protection frameworks applying to mobile payments in selected jurisdictions canada kenya and the united kingdom the main objective of this endeavour is to identify best practices that national authorities seeking to leverage mobile payments and similar innovations can emulate this book will be of interest to policymakers regulators industry stakeholders students and scholars interested in the regulation of innovative financial services particularly from a consumer protection perspective

most of the recent texts on compact modeling are limited to a particular class of semiconductor devices and do not provide comprehensive coverage of the field having a single comprehensive reference for the compact models of most commonly used semiconductor devices both active and passive represents a significant advantage for the reader indeed several kinds of semiconductor devices are routinely encountered in a single ic design or in a single modeling support group compact modeling includes mostly the material that after several years of ic design applications has been found both theoretically sound and practically significant assigning the individual chapters to the groups responsible for the definitive work on the subject assures the highest possible

degree of expertise on each of the covered models

diseases of the respiratory system often cause multisystem dysfunction and morbidity respiratory diseases not transmissible by a direct contact are rarer than those of inflammatory or infectious background such noncommunicable diseases often entailing genetic and immune aspects are areas of limited understanding sarcoidosis being a case in point this book tackles the issues relevant to such diseases the research on novel cytokine markers which may help in the diagnosis and management of sarcoidosis is described modern approaches to the management of pneumothorax a frequent accompaniment of lung diseases or chest wall trauma are dealt with as well there are also chapters that underscore the immuno inflammatory mechanisms of disorders seemingly unrelated to respiration such as obesity or aplastic anemia which may appreciably affect the control of the respiratory system and thus its vulnerability to diseases the book will be of interest to clinicians and medical researchers
