## **Solutions to Exercises in Intermediate Statistical Methods 2012-12-06**

this booklet contains hints to the solutions and answers where necessary  
of the exercises contained in intermediate statistical methods by g barrie  
wetherill the following principles have been adopted in dealing with the  
answers 1 in some cases the answer is the drawing of a graph and this  
has been omitted 2 in many numerical exercises a considerable amount  
of data snooping plotting of residuals etc should follow the main sis the  
inclusion of this material would make the answer booklet far too long 3 in  
some cases there is a readily available reference from which the answer  
can be obtained in which case reference has been made to this it is not  
necessary to work through every exercise but it should be recognised  
that the exercises are an integral part of the main text and a  
comprehensive grasp of the subject cannot be obtained without  
attempting a substantial proportion of them it is hoped that this booklet  
will be of assistance in pointing the way and providing a check on the  
more vital calculations the importance of numerical exercises should be

stressed and it is here that appendix b is of importance there is abundant material available there in many different fields of application currently we are in the process of mounting a form of appendix b on a computer together with accessing programs

## **Exercises in Wentworth's Analytic Geometry 2007**

The textbook begins with exercises related to radioactive sources and decay schemes. The problems covered include series decay and how to determine the frequency and energy of emitted particles in disintegrations. The next chapter deals with the interaction of ionizing radiation, including the treatment of photons and charged particles. The main focus is on applications based on the knowledge of interaction to be used in subsequent work and courses. The textbook then examines detectors and measurements, including both counting statistics and properties of pulse detectors. The chapter that follows is dedicated to dosimetry, which is a major subject in medical radiation physics. It covers theoretical applications such as different equilibrium situations and cavity theories, as well as experimental dosimetry, including ionization chambers and solid state and liquid dosimeters. A shorter chapter deals with radiobiology, where different cell survival models are considered. The last chapter concerns radiation protection and health physics. Both radioecology and radiation shielding calculations are covered. The textbook includes tables to simplify the solutions of the exercises, but the reader is mainly referred to important websites for importing necessary data.
