this historic book may have numerous typos and missing text purchasers can usually download a free scanned copy of the original book without typos from the publisher not indexed not illustrated 1919 edition excerpt psychology from the standpoint of a behaviorist chapter i problems and scope of psychology psychology a science of behavior psychology is that division of natural science which takes human activity and conduct as its subject matter it attempts to formulate through systematic observation and experimentation the laws and principles which underlie man's reactions every one agrees that man's acts are determined by something and that whether he acts orderly or not there are sufficient grounds for his acting as he does act if only these grounds can be discovered in order to formulate such laws we must study man in action his adjustments to the daily situations of life and to the unusual

situations which may confront him when sufficiently worked out the principles we obtain from such a study permit of two generalizations 1 to predict human activity with reasonable certainty it is sometimes asserted that we can never reach a point where such predictions can be made that human activity is too variable and determined by too many momentary conditions to permit us ever to reach such a goal a little consideration shows that common sense psychology is already and has been since the social life of man began making serviceable predictions every institution and custom we have depends upon it for example our savings banks churches and business when it comes to the individual the facts are not different we accept a man's note because we predict not always or ordinarily in words from our study of his character that he will pay it at the proper time the wife cheerfully begins the rearing of a family because she predicts that her husband will remain attached to her and provide herself and her children with bread we can

excerpt from behavior an introduction to comparative psychology this volume on behavior is an elaboration of the eight lectures given at columbia university during the winter of 1913 it has been written with the hope that it may be found serviceable in classroom work in psychology and biology needless technicalities and detailed references have been omitted for this reason the general reader may find something of interest in its pages the book must not be looked upon as a reference book or treatise the treatment of the research material has not been exhaustive for the most part no attempt has been made to give investigators detailed credit for their work i have not however been able to carry out consistently the plan of omitting references in most sciences which have existed for any length of time a general body of data becomes common property and it is unnecessary to mention the original discoverers of the universally accepted facts some parts of the study of behavior are so involved in controversy that no results can be said as yet to be universally accepted by specialists in the subject in dealing with these facts especially in the chapters on the sense organs it has been necessary to enter with some detail into the discussion of the investigations and theories of individual writers it is hoped that the volume will contribute something towards the introduction of more careful methods in the study of behavior and serve to mark off the study from the other sciences an endeavor has been made to adapt the book to the needs of various classes of readers where only a short time can be devoted to a classroom course in behavior i suggest that chapters i ii iii v vii and ix be omitted in the preparation of the manuscript my heaviest obligation is to dr k s lashley bruce fellow in biology the johns hopkins university
