1973

the large subfamily opiinae braconidae with about 2 000 valid species is a common group containing mainly small 2 5 mm parasitoid wasps of mainly mining or fruit infesting dipterous larvae several species are potentially of importance for biocontrol of dipterous pests and some have been used successfully for the first time the opiine fauna of a large area is fully illustrated by colour photographs and all known species are keyed thirty six new species out of 42 and two new gen era are described from hunan province oriental china thirty species have been sequenced and the results are discussed in additionÿ three species are re named and 27 new combinations are proposed

the moth genus *Lasionycta* Lepidoptera Noctuidae like several other genera that occur mainly in arctic and alpine areas are highly sought but rarely encountered by noctuid enthusiasts the diurnal species are occasionally seen by butterfly collectors who manage to get into these areas but light trapping in these remote habitats is very difficult the group has eluded a long needed revision because many species are similar exhibit a large amount of local and geographical variation and insufficient material has been available for revisionary work a large amount of material collected in the past 10 years has finally made a comprehensive revision of *Lasionycta* possible also most of the species were evaluated using mitochondrial cytochrome c oxidase *coi* dna sequences commonly called barcodes a relatively new taxonomic tool that has only recently come into common usage this revision treats the 43 species known to occur in north america 17 of which are described as new three quarters of the north american species are involved in taxonomic changes and five species associated with pacific coast beaches are removed from *Lasionycta* and placed in *Psammophila* a new genus the revision includes 246 color images of adults and genitalia as well as distribution maps for all species the results will also be interesting for palearctic researchers because four species are holarctic and some of the other approximately 12 old world species of *Lasionycta* are mentioned as occurring in holarctic species complexes several palearctic species are discussed in reference to excluding them from *Lasionycta* and returning them to the genera *Lasionhada*, *Eriopygodes* and *Clemathada*

Revision of the Southeast Asian millipede genus *Orthomorpha* Bollman, 1893, with the proposal of a new genus (*Diplopoda*, *Polydesmida*, *Paradoxosomatidae*)

2011-09-29

hoverflies of the subfamily microdontinae have a reputation for causing confusion the adult flies differ so much from other hoverflies that according to some they should be placed in a family of their own their diversity in shape and size is astonishing from large furry haired species and convincing wasp mimics to tiny unsightly creatures easily mistaken for something uninteresting this paper introduces a new genus

classification of the microdentinae a key to all 43 genera 7 subgenera and some species groups is presented all 552 available species names are classified into sub genera and species groups the resulting classification comprises 454 valid species and 98 synonyms of which 17 valid names and three synonyms are left unplaced a total number of 26 new species are described 267 new combinations of species and genera are proposed the paper concludes with a discussion on diagnostic characters of microdentinae

Revision of the subfamily Opiinae (Hymenoptera, Braconidae) from Hunan (China), including thirty-six new species and two new genera

this book studies the use of an automated writing evaluation awe systems in research paper revision for publication purposes by chinese doctoral students research writing skills are essential for achieving academic status and awe tools can be a great companion on the journey however awe tools may provide a disservice if users do not stay alert to inaccurate feedback inaccurate correction suggestions and missed errors the effects of accurate feedback on revision outcomes have been the focus of a number of awe studies but student engagement and revision results in cases of inaccurate feedback and missed errors have rarely been investigated such investigations can provide practical advice on using automated feedback in research writing this book provides a comprehensive evaluation of awe tools and profiles student engagement with tool use in cases of different qualities of feedback it can empower novice scholars and improve the effectiveness of academic writing instructors the findings can also inform awe system developers about possible ways of system improvement for research paper writing the book will be particularly useful to students and scholars of language and linguistic studies education and academic english writing

intended as a methodological and theoretical contribution to the study of religion and society this book examines buddhist monasticism in myanmar the book focuses on the shwegyin one of the most important but least understood monastic groups in the country analyzing the group as a tradition constructed around ideas of continuity and disruption rupture the study illuminates key aspects of monastic and wider burmese buddhist thought and practice and ultimately argues for the distinctiveness of elements of that thought and practice in comparison to the buddhist cultures of sri lanka and laos after situating the shwegyin within the history of buddhist monasticism more generally and within the vicissitudes of modern burmese political history the book proceeds along two scholarly avenues it adopts an interdisciplinary method with attention to biographical administrative doctrinal and ethnographic evidence theoretically the book engages scholarly discussion about traditions and their traditionalisms and advances a specific type of interpretive approach built on bringing the viewpoints and practices of the shwegyin into conversation with the enterprise of understanding larger historical and cultural patterns in the buddhist societies of south and southeast asia

1973

trigonalyidae hymenoptera is a worldwide small family in its own superfamily trigonalyiodea there are 93 recognized species in the world with 16 species in 6 genera are known from china before this study in this monograph the chinese fauna of trigonalyidae is revised keyed and fully illustrated for the first time fourty species in eight genera are recorded with twenty species are new for science and two species are new for china seven new synonyms are proposed one genus and six species are recognized as valid five new combinations are made four lectotypes are designated the results clarify some taxonomic confusion richen the species and geographical distributions and facilitate further taxonomic research of trigonalyidae

Mining Laws of Hungary

1931

the peanut shaped sternaspid polychaetes have been known since 1760 when plancus named them as mentula cucurbitacea marina sternaspids are common and abundant in soft bottoms some authors suggested that only one species should be recognized whereas others regard a few species very widely distributed and variable depths delineating species was problematic the ventro caudal shield was disregarded or barely used for identifying species in this contribution the ventral shield is evaluated and its diagnostic potential is confirmed the revision of sternaspis is based upon type or topotype materials sternaspid body introvert hooks and shield show three distinct patterns two genera have 7 abdominal segments and tapered introvert hooks and one genus has 8 abdominal segments and spatulate introvert hooks the ventro caudal shield has 3 different patterns stiff with ribs and sometimes concentric lines stiff with feebly defined ribs

no concentric lines and soft with firmly adhered sediment particles sternaspis is restricted to include species with 7 abdominal segments falcate introvert hooks and stiff shields often exhibiting radial ribs concentric lines or both two new genera incorporate the remaining species caulleryaspis has falcate introvert hooks 7 abdominal segments and soft shields with sediment particles firmly adhered on them petersenaspis has spatulate introvert hooks 8 abdominal segments and stiff shields with poorly defined ribs but no concentric line the geographic range of most species is smaller than previously indicated keys to genera and to all species are also included
