Receptors—Advances in

Research and Application: 2012 Edition

2012-12-26

interleukin 16 receptors advances in research and application 2012 edition is a scholarlybrief that delivers timely authoritative comprehensive and specialized information about interleukin 16 receptors in a concise format the editors have built interleukin 16 receptors advances in research and application 2012 edition on the vast information databases of scholarlynews you can expect the information about interleukin 16 receptors in this ebook to be deeper than what you can access anywhere else as well as

consistently reliable authoritative informed and relevant the content of interleukin 16 receptors advances in research and application 2012 edition has been produced by the world s leading scientists engineers analysts research institutions and companies all of the content is from peer reviewed sources and all of it is written assembled and edited by the editors at scholarlyeditions and available exclusively from us you now have a source you can cite with authority confidence and credibility more information is available at scholarlyeditions com

Wild Immunology—The Answers Are Out There

go into partnership with nature she does more than half the work and asks none of the fee martin h fisher nature has undertaken an immense amount of work throughout evolution the evolutionary process has provided a power of information that can address key questions such as which immune molecules and pathways are conserved across species which molecules and pathways are exploited by pathogens to cause disease what methods can be broadly used or readily adapted for wild immunology how does co infection and exposure to a dynamic environment affect immunity section 1 addresses these questions through an evolutionary approach laboratory mice have been instrumental in dissecting the nuances of

the immune system the first paper investigates the immunology of wild mice and reviews how evolution and ecology sculpt differences in the immune responses of wild mice and laboratory mice a better understanding of wild immunology is required and sets the scene for the subsequent papers although nature doesn't ask for a fee it is appropriate that nature is repaid in one form or another the translational theme of the second section incorporates papers that translate wild immunology back to nature but any non human non laboratory mouse research environment is hindered by a lack of research tools hence the underlying theme throughout the second section physiological resource allocation is carefully balanced according to the most important needs of the body tissue homeostasis can involve trade offs between energy requirements of the host and compensatory mechanisms to respond to infection the third section comprises a collection of papers that employ novel strategies to understand how the immune system is compensated under challenging physiological situations technology has provided substantial advances in understanding the immune system at cellular and molecular levels the specificity of these tools e.g. monoclonal antibodies often limits the study to a specific species or strain a consequence of similar genetic sequences or cross reactivity is that the technology can be adapted to wild species section 4 provides two examples of probing wild immunology by adapting technology developed for laboratory species

Emerging Concepts Targeting Immune Checkpoints in Cancer and Autoimmunity

2017-11-25

this volume reviews the current state of research on immune checkpoints and offers novel concepts it discusses the two most important immune checkpoints t lymphocyte associated antigen 4 ctla 4 and programmed cell death 1 pd 1 it shows that antagonistic antibodies against these two molecules are highly effective in the treatment of various cancers and that pd 1 and ctla 4 have been linked to the suppression of t cell receptor signaling and co stimulatory molecules further the volume examines other agents a number of cells receptors and signaling molecules that are also involved in the regulation of t cell activation and extends the concept of immune checkpoints to molecules and cells that negatively regulate t cell activation playing essential roles in immune homeostasis they could offer new targets for cancer immunotherapy and for the therapy of autoimmune diseases written by internationally respected scientists this book will appeal to basic scientists clinicians drug development researchers and advanced students alike

adaptive immune responses serve as a key defense mechanism for the control of infections in vertebrates

immune responses must be of sufficient strength to contain invading pathogens antigen specific responses require regulatory mechanisms to ensure termination or downmodulation to avoid excessive damage to the host tissue for both branches of the adaptive immune system regulatory molecules i e coreceptors and ligands have been identified that control the signaling cascades initiated by engagement of the t cell and b cell antigen receptors this book describes biological functions as well as molecular mechanisms of these molecules

the formation of disulphide bonds is probably the most influential modification of proteins these bonds are unique among post translational modifications of proteins as they can covalently link cysteine residues far apart in the primary sequence of a protein this has the potential to convey stability to otherwise marginally stable structures of proteins however the reactivity of cysteines comes at a price the potential to form incorrect disulphide bonds interfere with folding or even cause aggregation an elaborate set of

cellular machinery exists to catalyze and guide this process facilitating bond formation inhibiting unwanted pairings and scrutinizing the outcomes only in recent years has it become clear how intimately connected this cellular machinery is with protein folding helpers organellar redox balance and cellular homeostasis as a whole this book comprehensively covers the basic principles of disulphide bond formation in proteins and describes the enzymes involved in the correct oxidative folding of cysteine containing proteins the biotechnological and pharmaceutical relevance of proteins their variants and synthetic replicates is continuously increasing consequently this book is an invaluable resource for protein chemists involved in related research and production

Gene-Environment Interplay

2018-07-30

macrophages have unique and diverse functions necessary for survival and in humans and other species they are the most abundant leukocytes in tissues the innate functions of macrophages that are best known are their unusual ability to either kill or repair since killing is a destructive process and repair is a constructive process it was stupefying how one cell could exhibit these 2 polar opposite functions however in the late 1980 s it was shown that macrophages have a unique ability to enzymatically metabolize arginine to nitric oxide no a gaseous non specific killer molecule or to ornithine a precursor of polyamines and collagen for repair the dual arginine metabolic capacity of macrophages provided a functional explanation for their ability to kill or repair macrophages predominantly producing no are called m1 and those producing ornithine are called m2 m1 and m2 dominant responses occur in lower vertebrates and in t cell deficient vertebrates being directly driven by damage and pathogen associated

molecular patterns damp and pump thus m1 and m2 are innate responses that protect the host without adaptive immunity in turn m1 m2 is supplanting previous models in which t cells were necessary to activate or alternatively activate macrophages the th1 th2 paradigm m1 and m2 macrophages were named such because of the additional key findings that these macrophages stimulate th1 and th2 like responses respectively so in addition to their unique ability to kill or repair macrophages also govern adaptive immunity all of the foregoing would be less important if m1 or m2 dominant responses were not observed in disease but they are the best example to date is the predominance of m2 macrophages in human tumors where they act like wound repair macrophages and actively promote growth more generally humans have become m2 dominant because sanitation antibiotics and vaccines have lessened m1 responses and m2 dominance seems the cause of ever increasing allergies in developed countries obesity represents a new and different circumstance surfeit energy e g lipoproteins causes monocytes to become m1 dominant in the vessel walls causing plaques because m1 or m2 dominant responses are clearly causative in many modern diseases there is great potential in developing the means to selectively stimulate or inhibit either m1 or m2 responses to kill or repair or to stimulate th1 or th2 responses depending on the circumstance the contributions here are meant to describe diseases of m1 or m2 dominance and promising new methodologies to modulate the

the highly structured eucaryotic cell with its complex division of biochemical labour requires a distinct protein complement in each cellular structure and compartment nuclear coded and cytosolically synthesized polypeptides are specifically sorted to every corner of the cell in a post or co translational manner the presence of separate genomes and protein translation machineries in plastids and mitochondria requires further coordination not only on the transcriptional translational but also most likely on the protein import level numerous different protein transport systems have developed and coexist within plant cells to ensure the specific and selective composition of every sub cellular compartment this volume summarizes the current knowledge on protein trafficking in plant cells aside from the fundamental aspects in cell biology of how specific pre protein

sorting and translocation across biological membranes is achieved a major focus is on transport modification and deposition of plant storage proteins the increasing use of plants as bioreactors to provide custom designed proteins of different usage requires detailed understanding of these events this text is directed not only at students and professionals in plant cell and molecular biology but also at those involved in horticulture and plant breeding it is intended to serve as a text and guide for graduate level courses on plant cell biology and as a valuable supplement to courses in plant physiology and development scientists in other disciplines who wish to learn more about protein translocation in plants will also find this text an up to date source of information and reference
