excerpt from experimental engineering and manual for testing for engineers and for students in engineering laboratories this work deals principally with educational methods the use of apparatus and the preparation required for making a skilled observer it is believed however that the volume will not be without value as a reference book to the consulting and practising engineer since it contains in a single volume the principal standard methods which have from time to time been adopted by various engineering societies for the testing of materials engines and other machinery and an extensive series of tables useful in computing results it also contains a description of the apparatus required in testing and directions for taking data and deducing results in engineering experiments as applied in nearly every branch of the art an attempt has been made by dividing the book into several chapters of moderate length and making the paragraphs short to make references to the book easy to those who care to consult it the full list of subjects treated in the book is given in the table of contents which immediately follows the preface some of the more important divisions of the work are as follows about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy in rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition we do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works

A Manual of Civil Engineering

excerpt from a manual of engineering drawing for students and draftsmen there is a wide diversity of method in the teaching of engineering drawing and perhaps less uniformity in the courses in different schools than would be found in most subjects taught in technical schools and colleges in some well known instances the attempt is made to teach the subject by giving a series of plates to be copied by the student some give all the time to laboratory work others depend principally upon recitations and home work some begin immediately on the theory of descriptive geometry working in all the angles others discard theory and commence with a course in machine detailing some advocate the extensive use of models some condemn their use entirely different courses have been designed for different purposes and criticism is not intended but it would seem that better unity of method might result if there were a better recognition of the conception that drawing is a real language to be studied and taught in the same way as any other language with this conception it may be seen that except for the practice in the handling and use of instruments and for showing certain standards of execution copying drawings does little more in the study as an art of expression of thought than copying paragraphs from a foreign book would do in beginning the study of a foreign language and it would appear equally true that good pedagogy would not advise taking up composition in a new language before the simple structure of the sentence is understood and appreciated that is working drawings would not be considered until after the theory of projection has been explained after a knowledge of the technic of expression the penmanship and orthography the whole energy should be directed toward training in constructive imagination the perceptive ability which enables one to think in three dimensions to visualize quickly and accurately to build up a clear mental image a requirement absolutely necessary for the designer who is to represent his thoughts on paper that this may be accomplished more readily by taking up solids before points and lines has been demonstrated beyond dispute about the publisher forgotten books publishes hundreds of thousands of rare and classic books find more at forgottenbooks.com this book is a reproduction of an important historical work forgotten books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections

design engineering manual offers a practical guide to the key principles of design engineering it features a compilation of extracts from several books within the range of design engineering books in the elsevier collection the book is organized into 11 sections beginning with a review of the processes of product development and design the book goes on to describe systematic ways of choosing materials and processes it details the properties of modern metallic alloys including commercial steels cast irons superalloys titanium alloys structural intermetallic compounds and aluminum alloys the book explains the human system interface procedures to assess the risks associated with job and task characteristics and environmental factors that may be encountered at work and affect behavior product liability and safety rules are discussed the final section on design techniques introduces the design process from an inventors perspective to a more formal model called total design it also deals with the behavior of plastics that influence the application of practical and complex engineering equations and analysis in the design of products provides a single source of critical information to the design engineer saving time and therefore money on a particular design project presents both the fundamentals and advanced topics and also the latest information in key aspects of the design process examines all aspects of the design process in one concise and accessible volume
