Essential Architecture and Principles of Systems Engineering *2021-09-28*

this book is for everyone interested in systems and the modern practice of engineering
the revolution in engineering and systems that has occurred over the past decade has
led to an expansive advancement of systems engineering tools and languages a new age of
information intensive complex systems has arrived with new challenges in a global
business market science and information technology must now converge into a cohesive
multidisciplinary approach to the engineering of systems if products and services are
to be useful and competitive for the non specialist and even for practicing engineers
the subject of systems engineering remains cloaked in jargon and a sense of mystery
this need not be the case for any reader of this book and for students no matter what
their background is the concepts of architecture and systems engineering put forth are
simple and intuitive readers and students of engineering will be guided to an
understanding of the fundamental principles of architecture and systems and how to put
them into engineering practice this book offers a practical perspective that is
reflected in case studies of real world systems that are motivated by tutorial examples
the book embodies a decade of research and very successful academic instruction to
postgraduate students that include practicing engineers the material has been
continuously improved and evolved from its basis in defence and aerospace towards the
engineering of commercial systems with an emphasis on speed and efficiency most
recently the concepts processes and methods in this book have been applied to the
commercialisation of wireless charging for electric vehicles as a postgraduate or
professional development course of study this book will lead you into the modern
practice of engineering in the twenty first century much more than a textbook though
essential architecture and principles of systems engineering challenges readers and
students alike to think about the world differently while providing them a useful
reference book with practical insights for exploiting the power of architecture and
systems

the book scatter search by manuel laguna and rafael martí represents a long awaited missing link in the literature of evolutionary methods scatter search ss together with its generalized form called path relinking constitutes the only evolutionary approach that embraces a collection of principles from tabu search ts an approach popularly regarded to be divorced from evolutionary procedures the ts perspective which is responsible for introducing adaptive memory strategies into the metaheuristic literature at purposeful level beyond simple inheritance mechanisms may at first seem to be at odds with population based approaches yet this perspective equips ss with a remarkably effective foundation for solving a wide range of practical problems the successes documented by scatter search come not so much from the adoption of adaptive memory in the range of ways proposed in tabu search except where as often happens ss is advantageously coupled with ts but from the use of strategic ideas initially proposed for exploiting adaptive memory which blend harmoniously with the structure of scatter search from a historical perspective the dedicated use of heuristic strategies both to guide the process of combining solutions and to enhance the quality of offspring has been heralded as a key innovation in evolutionary methods giving rise to what are sometimes called hybrid or memetic evolutionary procedures the underlying processes have been introduced into the mainstream of evolutionary methods such as genetic algorithms for example by a series of gradual steps beginning in the late 1980s
