

Free ebook Question with acid rain as the answer Full PDF

acid rain as the result of sulfur dioxide and nitrogen dioxide emissions from factories and power plants. It is a major environmental problem in many parts of the world. The pH of acid rain is typically between 4.0 and 5.5, which is significantly lower than the pH of normal rain (around 5.6). Acid rain can cause damage to buildings, forests, and aquatic life. It is also a major cause of soil acidification and water pollution. The problem of acid rain is particularly acute in industrialized countries, where emissions of sulfur dioxide and nitrogen dioxide are high. In the United States, the Clean Air Act of 1990 has helped to reduce emissions of these pollutants, but the problem of acid rain remains a significant environmental challenge. In Canada, acid rain has caused significant damage to forests and lakes. In Europe, acid rain has caused damage to buildings and forests. In China, acid rain is a major environmental problem in many parts of the country. The problem of acid rain is a global one, and it requires international cooperation to solve. The United Nations Environment Programme (UNEP) has been working to address the problem of acid rain since the 1970s. It has developed a global network of monitoring stations to track the levels of sulfur dioxide and nitrogen dioxide in the atmosphere. It has also developed a global convention on long-range transboundary air pollution, which has been signed by many countries. The convention requires countries to take measures to reduce emissions of sulfur dioxide and nitrogen dioxide, and to cooperate in monitoring and assessing the levels of these pollutants in the atmosphere. The convention also requires countries to provide information on their emissions and to consult with each other on measures to reduce emissions. The convention is a landmark agreement in the history of international environmental law, and it has helped to bring the problem of acid rain to the attention of the world's leaders. It has also helped to establish a framework for international cooperation to address the problem of acid rain. The convention is a testament to the fact that environmental problems do not respect national boundaries, and that they require international cooperation to solve. The problem of acid rain is a global one, and it requires international cooperation to solve. The United Nations Environment Programme (UNEP) has been working to address the problem of acid rain since the 1970s. It has developed a global network of monitoring stations to track the levels of sulfur dioxide and nitrogen dioxide in the atmosphere.
