in the conduct of continuing research to improve screening and induction techniques the input quality task has explored the potential contribution of programmed testing particularly with respect to use of the branching technique which tests the examinee with items appropriate to his own ability level the present publication reports on the trial administration of two branching tests by means of a computerized system with teletypewriter input output developed by the national bureau of standards a specific objective was to determine the comparability of computerized branching tests and conventional paper and pencil tests with reference to reliability test score information and test construction rationale the

two specially constructed 8 9 item branching tests verbal and arithmetic reasoning and corresponding conventional 40 and 50 item tests of the army classification battery acb were administered in counter balanced order to a sample of 102 enlisted men statistical analyses of score results and observations of response patterns are presented findings indicated substantial correlation of the short branching tests with their longer conventional counterpart tests $r = .83$ and $.79$ greater than would be expected with equally short conventional tests findings also reinforced the research promise of branching tests and indicated the need for reexamination of classical test theory author

is the topic analog testing and diagnosis timely
yes indeed it is testing and diagnosis is an
important topic and fulfills a vital need for the
electronic industry the testing and diagnosis of
digital electronic circuits has been successfully

developed to the point that it can be automated unfortunately its development for analog electronic circuits is still in its stone age the engineer's intuition is still the most powerful tool used in the industry there are two reasons for this one is that there has been no pressing need from the industry analog circuits are usually small in size sometimes the engineer's experience and intuition are sufficient to fulfill the need the other reason is that there are no breakthrough results from academic research to provide the industry with critical ideas to develop tools this is not because of a lack of effort both academic and industrial research groups have made major efforts to look into this problem unfortunately the problem for analog circuits is fundamentally different from and much more difficult than its counterpart for digital circuits these efforts have led to some important findings but are still not at the point of being practically useful however these situations are now changing the current trend for the design of vlsi chips is to use analog digital hybrid circuits instead of digital circuits from the past therefore even if a preface though the analog circuit may be small the total circuit under testing is large
