Web Authentication using Third-Parties in Untrusted Environments 2016-08-22 with the increasing personalization of the many websites allow users to create their own personal accounts this has resulted in users often having many accounts on different websites to which they need to authenticate in order to gain access unfortunately there are several security problems connected to the use and re use of passwords the most prevalent authentication method currently in use including eavesdropping and replay attacks several alternative methods have been proposed to address these shortcomings including the use of hardware authentication devices however these more secure authentication methods are often not adapted for mobile users who use different devices in different places and in untrusted environments such as public wi fi networks to access their accounts we have designed a method for comparing evaluating and designing authentication solutions suitable for mobile users and untrusted environments our method leverages the fact that mobile users often bring their own cell phones and also takes into account different levels of security adapted for different services on the another important trend in the authentication landscape is that an increasing number of websites use third party authentication this is a solution where users have an account on a single system the identity provider and this one account can then be used with multiple other websites in addition to requiring fewer passwords these services can also in some cases implement authentication with higher security than passwords can provide how websites select their third party identity providers has privacy and security implications for end users to better understand the security and privacy risks with these services we present a data collection methodology that we have used to identify and capture third party authentication usage on the we have also characterized the third party authentication landscape based on our collected data outlining which types of third parties are used by which types of sites and how usage differs across the world using a combination of large scale crawling longitudinal manual testing and in depth login tests our characterization and analysis has also allowed us to discover interesting structural properties of the landscape differences in the cross site relationships and how the use of third party authentication is changing over time finally we have also outlined what information is shared between websites in third party authentication dened risk classes based on shared data and proled privacy leakage risks associated with websites and their identity providers sharing data with each other our ndings show how websites can strengthen the privacy of their users based on how these websites select and combine their third parties and the data they allow to be shared

Safety and Security in Multiagent Systems 2009-10-15 as intelligent autonomous agents and multiagent system applications become more pervasive it becomes increasingly important to understand the risks associated with using these systems incorrect or inappropriate agent behavior can have harmful fects including financial cost loss of data and injury to humans or systems for ample nasa has proposed missions where multiagent systems working in space or on other planets will need to do their own reasoning about safety issues that concern not only themselves but also that of their mission likewise industry is interested in agent systems that can search for new supply opportunities and engage in semi automated negotiations over new supply contracts these systems should be able to securely negotiate such arrangements and decide which credentials can be requested and which credentials may be disclosed such systems may encounter environments that are only partially understood and where they must learn for themselves which aspects of their environment are safe and which are dangerous thus security and safety are two central issues when developing and deploying such systems we refer to a multiagent system s security as the ability of the system to deal with threats that are intentionally caused by other intelligent agents and or s tems and the system s safety as its ability to deal with any other threats to its goals
