Model Theory of Operator Algebras

the theory of operators stands at the intersection of the frontiers of modern analysis and its classical counterparts of algebra and quantum mechanics of spectral theory and partial differential equations of the modern global approach to topology and geometry of representation theory and harmonic analysis and of dynamical systems and mathematical physics the present collection of papers represents contributions to a conference and they

have been carefully selected with a view to bridging different but related areas of mathematics which have only recently displayed an unexpected network of interconnections as well as new and exciting cross fertilizations our unifying theme is the algebraic view and approach to the study of operators and their applications the complementarity between the diversity of topics on the one hand and the unity of ideas on the other has been stressed some of the longer contributions represent material from lectures in expanded form and with proofs for the most part however the shorter papers as well as the longer ones are an integral part of the picture they have all been carefully refereed and revised with a view to a unity of purpose timeliness readability and broad appeal raul curto and paule t

dr seuren's study deals with the problem of presenting an adequate model of grammatical description the model he proposes conforms in its main outlines to the transformational generative grammar established by chomsky but differs in important respects these mainly affect that part of chomsky's syntactic component known as the base which generates basic or deep structures in the model of the base proposed here two main constituents are distinguished for every deep structure representation of a sentence vis a vis the operators

and the nucleus the deep structure of a sentence is thus seen to be very similar to the logical structure of a proposition the arguments given in support of this analysis are based on mainly on considerations of simplicity and semantic adequacy
