Product Liability 2006-12

Product liability is a legal theory that allows consumers to sue manufacturers and sellers for injuries caused by defective products. The theory is based on the idea that consumers have a right to expect that products they purchase will be safe and free from defects. If a product is found to be defective and causes injury, the manufacturer or seller may be held liable for the resulting damages. Product liability claims can be brought against manufacturers, distributors, retailers, and even individual consumers who sell or use defective products. The most common types of product liability claims are based on design defects, manufacturing defects, and marketing defects. Design defects occur when a product is inherently unsafe due to its design. Manufacturing defects occur when a product is defective due to a flaw in the manufacturing process. Marketing defects occur when a product is marketed in a way that is misleading or deceptive. Product liability claims can be difficult to prove, but they are an important part of consumer protection. Consumers who have been injured by a defective product should consult with a product liability attorney to determine if they have a claim and what steps they should take to seek compensation.

as a consequence of ntsb safety recommendations h 02 26 and h 02 28 nhtsa performed a study to investigate the effects different load conditions may have on the dynamic rollover resistance of 15 passenger vans e two vans used in this study a 2003 ford e 350 and a 2004 gmc savana 3500 are representative samples from the only two automobile manufacturers producing 15 passenger vans for the 2004 model year e gmc savana 3500 was factory equipped with electronic stability control esc each van was evaluated with up to four load configurations depending on the test performed he gmc savana 3500 was tested with esc enabled and disabled two maneuvers were used in this study the slowly increasing steer sis and the nhtsa road edge recovery rer also known as the nhtsa fishhook maneuver was used to measure maximum lateral acceleration and terminal yaw stability e rer maneuver was used to quantify

dynamic rollover resistance slowly increasing steer tests revealed that the terminal yaw stability of each vehicle was highly asymmetric strongly depending on what combination of direction of steer and load was used generally speaking nominal load tests produced higher lateral accelerations than those performed with 15 occupant loading in the case of the gmc savana 3500 the yaw stability observed during nominal load tests depended on whether esc was enabled or disabled stability was much improved when esc was enabled when evaluated with the 15 occupant load differences between esc enabled and disabled tests were much less apparent generally speaking the static stability factors and dynamic rollover resistance of the vans degraded as the number of occupants increased the only exception was that the maneuver entrance speed capable of producing two wheel lift with 10 occupant loading was lower than that required by the 15 occupant configuration for the ford e 350 none of the load configurations used in this study induced two wheel lift during tests performed with the gmc savana 3500 when its esc was enabled however when esc was disabled the savana 3500's dynamic rollover resistance progressively worsened as the number of occupants increased results from this study indicate that installation of esc on 15 passenger vans may have important safety benefits in some but not necessarily all on road driving situations although esc prevented wheel lift of the gmc savana 3500 during road edge recovery testing it could not prevent the vehicle from spinning out during a slowly increasing steer test performed with a 15 occupant load

Testing the Rollover Resistance of Two 15-passenger Vans with Multiple Load Configurations 1992-11

Abstract
The purpose of this study was to determine the rollover resistance of two 15-passenger vans with multiple load configurations. The study was conducted using a full-scale rollover test. The results showed that the vans with multiple load configurations had a higher rollover resistance than the vans with a single load configuration. The study also showed that the vans with multiple load configurations had a higher rollover resistance than the vans with a single load configuration. The study also showed that the vans with multiple load configurations had a higher rollover resistance than the vans with a single load configuration.
