five years ago the first edition of the plant molecular biology manual appeared at that time the editors felt that the field of plant molecular biology had matured to a point that the publication of a series of protocols in plant molecular biology was warranted during the past five years the field of plant molecular biology has expanded rapidly this expansion is among other things reflected by the presence of several journals in the plant sciences as well as by the increasing amount of plant sciences articles that are published in the more general journals in 1991 approximately 3000 people attended the third international congress of plant molecular biology in tucson arizona where more than 2000 posters were presented it is also remarkable to see that nowadays botanical and physiological meetings pay a considerable amount of attention to plant molecular biology since the first edition of this manual appeared we have published yearly a series of supplements to the original volume these supplements covered new subjects and described new methods that had been developed with time however the editors realized that the original manual plus supplements had become cumbersome to use and we decided to publish a reorganized version of the manual

this book examines an intelligent system for the inspection planning of prismatic parts on coordinate measuring machines cmms the content focuses on four main elements the engineering ontology the model of inspection planning for prismatic parts on cmms the optimisation model of the measuring path based on an ant colony approach and the model of probe configuration and setup planning based on a genetic algorithm the model of inspection planning for cmms developed here addresses inspection feature construction the sampling strategy probe accessibility analysis automated collision free operation and probe path planning the proposed model offers a novel approach to intelligent inspection while also minimizing human involvement and thus the risk of human error through intelligent planning of the probe configuration and part setup the advantages of this approach include reduced preparation times due to the automatic generation of a measuring protocol potential optimisation of the measuring probe path i e less time needed for the actual measurement and increased planning process autonomy through minimal human involvement in the setup analysis and probe configuration
